ACKNOWLEDGEMENTS

JMA would like to thank the New Castle Historical Society and the volunteers who helped with excavations at the Dutch House. Mike Connelly, director of the New Castle Historical Society, and his staff helped make us comfortable during the weeks of fieldwork. Susan Richman, James Meek, and Jesse Gagnon helped clean artifacts. Our dutiful screeners included Patricia Bird, Susan Hannell, Nancy Parker, Bruce Dalleo, Mike Shook, Ann McKelvie, Pamela and Rebecca Hagerty, Joan Smith, and Janet Marie Grosso. On the last day of excavations many residents and a number of colleagues came by the Dutch House to see and hear about our findings. We appreciate their support and enthusiasm.

1.0 INTRODUCTION

1.1 PURPOSE AND GOALS OF THE INVESTIGATION

JMA (John Milner Associates, Inc.) conducted archeological investigations during the month of July 2011 in the rear yard of the Dutch House property in New Castle, Delaware. Investigations were conducted for the New Castle Historical Society (NCHS) in advance of the proposed installation of a native-plant garden, which would entail immediate and long-term ground disturbance through the planting of bushes, trees, and new grass (Figures 1 and 2). The goal of archeological investigations was to obtain information on the areas subject to disturbance, and, in the event that significant subsurface archeological remains were encountered, to provide recommendations for their preservation and/or excavation.

1.2 ENVIRONMENTAL SETTING

The Dutch House parcel is within the Upper Delaware Coastal Plain Physiographic Zone. The area is underlain by the Columbia Formation, composed of a medium to coarse, tan to brown to reddish brown quartz sand with variable gravels and light gray silt components. Along the coast stretching from South Wilmington to northwest of Lewes the Columbia Formation is overlain by the Scotts Corner Formation, a light gray to brown sand and pebbles with interspersed beds of organic clayey silt deposited during multiple cycles of sea-level rise and fall (Groot and Jordan 1999).

Soils in the project area are in the Aldino-Keyport-Mattapex-Urban land association (Matthews and Lavoie 1970:General Soil Map, Sheet 21). Soils of this association occur on level to gently sloping terrain, are moderately well drained, and of a medium texture. The soils occur in areas with little to extensive disturbance. The introduction of fill to improve drainage is common (Matthews and Lavoie 1970:7-8).

The parcel is situated near the New Castle Green, which is at the highest point within the historic part of New Castle. The central part of town is surrounded by poorly drained lands that fall to the Delaware River to the southeast, and marshland to the northeast and southwest. The relatively level landscape evident today resulted from grading to improve drainage and to create fast land. Grading was most commonly achieved by the filling of marshland; however, evidence of cutting exists at discrete locations throughout the town (Heite and Heite 1989:40, 49; Cottrell 1990:34).

1.3 ARCHEOLOGY IN NEW CASTLE

Substantial archeological investigations have occurred in five instances within and surrounding the New Castle Green and Court House. In 1955 investigations were conducted within the court house in conjunction with restoration efforts (Eckman 1950; Wolcott 1957; Kruse 1966). A portion of a nearly 2.5-foot thick stone wall measuring 30 feet by 30 feet was found beneath the central part of the court house. The fill within the foundation exhibited evidence of a fire, and held artifacts whose date of manufacture was during and before the 1730s (Wolcott 1957:205; Guerrant 1984). Investigations in the yard of the Sheriff's House in 1976 revealed a cellar hole that was photographed and mapped, but not excavated (Guerrant 1984). Excavations from 1981 through 1982 exposed an 1805-1806 brick foundation, a cellar hole and stairwell associated with the 1857 jail, and remnants of a stone foundation associated with the seventeenth century court house (Guerrant 1984).

Figure 2. Arasapha Garden Club proposed plan for tree and bush plantings for the Native Garden.

Excavations of the plaza at the front of the court house occurred in 1995 and in 2006. In each instance a nineteenth century surface was located beneath fill layers that were introduced during construction of the plaza, which occurred in two phases (Catts and Tobias 2006:80). Identified features consisted primarily of post holes related to construction of the court house, and those caused by erosion. An area of scorched earth, and an undocumented brick foundation, cellar hole, and palisade trench, each believed to be related to the first court house, were also located (Catts and Tobias 2006:82-84).

Archeological investigations occurred at Immanuel Church prior to reconstruction after a fire in 1980. Excavations resulted in the identification of five soil strata, twenty-two church-related features, and two seventeenth-century features. Also documented were six previously unrecorded burials, and two marked burials. The soil layers represented the 1860 renovation, the colonial-period surface, the original ground surface, and two layers of subsoil. Features exposed during excavations included small pits related to former architectural elements or were presumed to be construction-related features. Builders' trenches related to two periods of construction were documented, as well as brick footings and piers, and a segment of mortar floor. Two linear features in the strata that pre-dated the church were suggestive of an earlier structure (Roberts 1987:11-21).

Thirteen excavation units were dug on the Green in 2010 before the installation of a storm tank to be connected to the roof drains of the Arsenal. An intact ground surface that built up over time was found beneath a fill layer of coal and coal ash slag that underlies the current topsoil layer. The earlier surface appeared to be stratified; however, excavation intervals were too large to clearly distinguish a pattern other than noting that the artifact assemblage of the upper level consisted of a remarkable number of school-related items, while the lowest level contained more redwares and only a few refined wares (Mancl and Catts 2011).

Installation of a French drain prompted excavation of a unit and a narrow trench in the yard of the Amstel House. Excavations uncovered part of the remains of the Waterworks Office that once stood adjacent to the Amstel House along Delaware Street, a brick walkway, a gravel walkway and a fence line. The brick walkway was covered during landscaping conducted in the 1930s. The gravel walkway dated to the mid-nineteenth century, while the fence line postdated the walkway (Mancl 2009).

The University of Delaware Department of Anthropology and the Historical Society of Delaware conducted excavations at the Read House and Gardens during the 1990s. Excavations focused on the yard of a house that stood where there is now a formal garden. The yard contained deposits beginning with the arrival of the Dutch in the seventeenth century. Features discovered included a kitchen midden, a well, a possible privy, an outbuilding and possible cellar hole. Information was also obtained about modifications to the landscape in the nineteenth and twentieth centuries. Specifics on work at the Read House will be presented in a forthcoming report (Lu Ann De Cunzo, personal communication, 2011).

Limited archeological testing took place on land held by the Trustees of the New Castle Commons at the southeastern end of Chestnut Street. Investigations focused on the portion of the parcel referred to as the "Fort [Casimir] Lot" in 1679. Excavations revealed seventeenth century artifacts in a ditch feature, and extensive fill deposits used to extend the shoreline out into the Delaware River. Post holes with molds were found within the ditch fill. It was concluded that the features were remnants of Fort Casimir, established by the Dutch in 1651 (Heite and Heite 1986).

In addition to the archeological work that has been conducted in New Castle, the Trustees of the New Castle Commons contracted for the creation of an archeological preservation plan for the town (Heite and Heite 1989). The authors characterized the present-day ground surface on which the Dutch House stands

as having been filled to bring the yards up to the grade of Third Street. An excavation unit placed in the yard of 8 East Third Street was dug through layers characterized as fill to a depth of two feet below the ground surface, where either fill or subsoil was encountered. The upper foot held coal and coal ash slag. The earliest artifacts recovered dated to the latter part of the eighteenth century. The authors also reported that Mrs. Alison Jarvis had unearthed a variety of nineteenth century ceramics while gardening in the rear yard of the Dutch House, as well as a pipe bowl with the mark of a maker who worked from 1707 to 1723. They recommended that archeological investigations take place before activities that would “cut deeply” into subsurface deposits (Heite and Heite 1989:44-45).

2.0 METHODS

2.1 BACKGROUND RESEARCH

JMA reviewed a historic structures report prepared on the Dutch House (Klee 2003), as well as reports on archeological investigations conducted in the City of New Castle before beginning fieldwork. Also reviewed were soils data, and historical maps and photographs that depicted the project area. Additional historical information was gathered from the archive of the New Castle Historical Society after the completion of excavations.

2.2 FIELD INVESTIGATIONS

The Scope of Work called for excavating up to 20 2.5x2.5-foot excavation units (EUs) in the areas of anticipated ground disturbance. Their placement had two purposes: 1) to confirm and understand sub-surface anomalies indicated by the GPR investigation conducted by JMA in 2010 (Leach and Chadwick 2010), and 2) to understand changes in the landscape over time. Additional EUs would be placed to further expose any features encountered, if deemed necessary, and investigate tree planting locations not included in the initial plan. Excavation was done by a combination of cultural and arbitrary levels. The original intent was to excavate to sterile soils except where a cultural feature was encountered. However, it was found early in the investigations that sterile soils were much deeper than anticipated; therefore, in the interest of achieving sufficient horizontal coverage of the rear yard excavations were stopped at what had been determined to be the an eighteenth-century ground surface laying on top of the subsoil. Samples were taken for floatation from the eighteenth-century ground surface in two EUs.

Soils from EUs and features were passed through ¼-mesh hardware cloth. All but obviously recent artifacts such as plastics and styrofoam, and coal and coal ash slag were placed in bags marked with the appropriate provenience information for EUs 1 through 10. An upper layer of topsoil, and coal and coal ash slag were removed without screening in subsequent EUs and shovel tests (STU). Locational and stratigraphic information was recorded on pre-printed forms. Digital photography was used to further document each EU and feature.

The grid created for an earlier ground-penetrating radar survey was used to establish the location of EUs (see Leach and Chadwick 2010). Locational information recorded for each EU references its northeast corner. Elevations for stratigraphic and arbitrary layers for each EU were taken from a datum placed 0.2 feet above the ground surface at the northeast corner of the respective unit. The elevation above sea level of the ground surface at the northeast corner of each EU was determined by using a Total Station to link project area survey data to a National Geodetic Survey benchmark placed on the base of the New Castle-Frenchtown Railroad monument located near the Arsenal between Second Street and Market Street.

2.3 LABORATORY PROCEDURES

All recovered artifacts were cleaned and inventoried in accordance with the Delaware State Museum's *Guidelines and Standards for the Curation of Archaeological Collections* (Fithian n.d.). Artifact identification was based minimally on type and material. Where possible, artifacts were further identified by function and/or cultural affiliation. Cataloged artifacts were placed in heavy-duty archivally stable plastic bags for permanent storage. An acid-free provenience tag was placed in each bag. Provenience information

was also written on the outside of the bags using a permanent marker. The brick collected was weighed in the field and a representative sample was saved for curation. All artifacts, maps, photographs, and field notes will be submitted to the New Castle Historical Society for permanent curation.

3.0 DUTCH HOUSE PROPERTY HISTORY

Land records indicate that a log house in the hands of George More stood on the Dutch House parcel in 1682, with a 1686 purchase of an adjacent lot describing it as being located on the 3rd (Minquas) Street side (Klee 2003:14, Heite 1978:100) (Figure 3). Architectural historian Jeffrey Klee stated that the timber-framed part of the Dutch House was built a decade either side of 1700 by either John Walker, who was possibly a farmer, or Paul Barnes, listed as a turner. A lean-to addition to the rear of the house was built some time before 1730 by Samuel Silsbee, Sr., a blacksmith. Shortly after, the house was raised to dig a cellar and the exterior was clad in brick. An Orphan's Court record of 1795 notes that a stable also stood on the property (Klee 2003:16, 11, 24, 13). However, Henry Latrobe's 1805 Plan of New Castle does not depict another structure of the property (Figure 4). In the least there was likely a privy, a type of structure infrequently depicted. The map also depicts what are either lot or fence lines, more likely the latter given their configuration throughout the town. For the Dutch House and a few others in town, the line runs from the center of the rear of the house, suggesting a division of space for multiple occupants, or perhaps a means of signaling a separation between public and private areas.

The house remained in the Silsbee family until 1810. Presumably the family occupied the house, first by Samuel Silsbee, Jr., his wife Mary, and children John, Joseph, and Mary. All the men in the family were carpenters. On the death of John (1790) and Joseph (1791), their sister Mary Thompson inherited the property. Thompson left the property to her children, John and Mary. They did not live in the house, but rather rented it to Henry Rowan. Census records indicate that the Rowan family consisted of five people. Also listed with the household were three "non-white" free people and one slave (Klee 2003:12-13).

In 1810 John Springer bought the property and it remained in his family until 1855 when it was sold to William Dobb (Klee 2003:42-43). The 1848 Coastal Survey map depicts structures all along the back of the lots on 4th (Vine) Street (Figure 5). However, the 1868 Beers Atlas of New Castle does not depict any other structures on the property or along the back of the other lots (Figure 6). It is possible that the depiction on the Coastal Survey map is incorrect; however, it is fairly detailed, suggesting that it included outbuildings frequently omitted on other maps.

The parcel changed hands frequently during the latter part of the nineteenth century. The first depiction of another structure on the property occurred on the 1891 Sanborn map (Figure 7). A frame house had been built at the location of the current garden along 3rd (Orange) Street. At the rear of the yard was a one-story building labeled "shanty" and a small one-story structure. Deed records indicate that the house and shanty had been built between 1879 and 1883 (Klee 2003:40-41). By 1901 a small addition had been added to the rear of the house on 3rd Street (Figure 8). The shanty and small structure depicted in 1891 were gone, and a structure with a shed had been built on the western end of the property along 4th (Vine) Street and a shed on the northern end. The Sanborn maps no longer depicted the shed on the northern end by 1907, while the other structure was removed by 1912, to be replaced by a garage by 1923.

In January of 1938 the Delaware Society for the Preservation of Antiquities (DSPA) bought the Dutch House property and the parcel to the southwest that held the frame house (Klee 2003:38-39). Minutes of a DSPA meeting held January 3, 1939 indicate that landscaping work was begun in 1938. Noted in the minutes were the planting of box bushes, two *Pyracantha* trees, eight "oldest period roses," and 500 tulip bulbs. (All meeting minutes, reports, and landscape plans noted are in the archives of the NCHS.) The 1943 Sanborn map depicted that the frame house had been removed. Jean Reynolds, a neighbor adjacent to the Dutch House at 39 East 4th Street, told JMA that her house was the frame house that had been removed (personal communication, June 2011).

Figure 4. The Dutch House lot shown on a detail of the 1805 Latrobe Plan of the Town of New Castle.

Figure 7. The Dutch House lot shown on the 1891 Sanborn map of New Castle, Delaware.

Figure 8. The Dutch House lot shown on the 1901 Sanborn map of New Castle, Delaware.

An undated landscape plan prepared by Wheelwright and Stevenson, Landscape Architects, illustrated pear trees proposed for planting along the northerly and westerly sides of the rear yard (Figure 9). It is not known if all of the trees were actually planted. However, minutes of a meeting of the Arasapha Garden Club in April of 1951 noted that money was requested and approved for creating a rosebed along the northerly side of the rear yard “to the fruit tree on 4th St.” The minutes also describe plans to raise the ground level to the curb, lay a brick sidewalk, and create beds to either side of “a gate,” presumably referring to a gate along 4th Street, as minutes of a June 1954 meeting noted the completion of a dividing fence.

The dividing fence was illustrated on a plan to change the landscaping prepared in 1953 by Homsey Architects (Figure 10). Changes planned for the rear yard included the planting of “dwarf fruit trees.” The plan also illustrated that at least two of the pear trees shown on the Wheelwright and Stevenson plan had been planted. Related to the proposed changes, the records of the garden club contain an invoice dating to September of 1953 for four loads of topsoil to be used to fill low areas.

The last record located was an April 1983 Dutch House garden report prepared by the Arasapha Garden Club. Noted in the report was the plan to roto-till the current beds to install a perennial garden. Included in the report was a sketch of the rear yard that illustrated two trees near the former gate along 4th Street, and an apple tree near the eastern corner of the yard.

Figure 9. Detail of a proposed landscaping plan for the rear yard of the Dutch House prepared by Wheelwright and Stevenson, Landscape Architects. Not dated.

Scale unknown

Figure 10. Detail of a proposed landscaping plan for the rear yard of the Dutch House prepared by Homsey Architects, 1953. Proposed trees listed as “dwarf fruit trees.”

4.0 FIELDWORK

Excavations in the rear yard of the Dutch House consisted of 13 EUs and 7 STUs (Figures 11 and 12). Two earlier ground surfaces were located, each covered by a layer of fill. Two post holes, a pit feature, and the remnants of a foundation were also found. Rather than treating each EU separately, the soil layers are discussed here as individual analytical units. A photograph and drawing of EU 1 along with a representative soil profile are included as Figure 13. Cultural features are discussed individually.

On average the current topsoil consisted of 0.2 feet to 0.3 feet of very dark gray brown (10YR3/2) sandy silt containing artifacts from a variety of periods. For example, white salt-glazed stoneware (1740-1775), creamware (1775-1820), whiteware (1810-present), machine-made bottle glass (1903-present), and coins from the 1980s were all recovered from this layer. Beneath the topsoil was a layer similar in color, texture, and artifact content, but with up to 20 percent coal and coal ash slag. The layer extended up to a foot below the ground surface.

The third soil layer was a fine sandy silt that varied in color from a dark grayish brown (2.5Y4/2) to dark yellowish brown (10YR4/4). Its thickness also varied ranging from 0.5 feet to a foot thick, being greatest toward the house, and least near 4th Street, except at the southwest corner. Datable artifacts resulted in a mean date for the layer of 1833, and a terminus post quem (TPQ) of 1903. Initial and final mean dates were 1786 and 1880, respectively. Four features cut into the layer: Feature 1, Feature 6, Feature 7, and one that was not distinguished as a feature in the field.

The dominant artifacts recovered from the third layer belonged to the architectural and kitchen/food-related functional groups. Brick fragments (n=272), sherds of window glass (n=284), and nails (n=139) were the most common architectural artifacts. Brick discarded in the field was roughly a little under the equivalent of 3 whole bricks. Five of the nails recovered were identifiable as either cut or wrought, with the remainder being too corroded to characterize. Of 20 hardware artifacts, only an escutcheon and 2 drainpipe fragments were identifiable beyond the basic category and material. Of the kitchen/food-related artifacts ceramic sherds were the most common (n=903), followed by bottle glass fragments (n=291). The vast majority of ceramic sherds were common types found on archeological sites: redware (n=250), whiteware (n=150), pearlware (n=164), and creamware (n=153). Of the bottle glass fragments, 79 were blown-in-mold, and 15 were machine-made. The remainder were not identifiable as to type. Food remains recovered consisted of 138 bone and oyster shell fragments, 1 clam shell fragment, and 5 pigs' teeth. One fragment of pressed-glass tableware was also recovered.

Forty-four historic-period artifacts represented other categories: pipe bowl or stem fragments (n=19), ceramic flower pot sherds (n=9), unidentifiable metal fragments (n=6), buttons (n=5), a glass chimney lamp fragment, a slate pencil, a brass thimble, and a metal drawer or door pull. Prehistoric artifacts were represented by 3 chert flakes. These artifact counts do not include the few found in features.

Feature 1 was encountered at 0.9 feet below the surface in EU 2, beneath soils that elsewhere on the property overlay the third layer. The feature was originally defined as a gray (10YR6/1) ash deposit covering the eastern half of the unit (Plate 1). The western half, a yellowish brown (10YR5/4) silty clay, was designated as the fourth layer in the unit. As excavation progressed, it became apparent that the two halves delineated either side of a brick foundation although the intact bricks had been removed, leaving behind only fragments (Plate 2). The third soil layer, as defined within the analytical framework, began immediately beneath Feature 1; however, a thin lens consisting mainly of oyster shell covered the third layer within the western half of the unit. The entire deposit was therefore redefined as Feature 1. There were not enough datable artifacts to calculate a mean date, but the general dates of the artifacts were

Figure 11. Plan of Excavation and Shovel Test Units established during archeological investigations of the rear yard of the Dutch House.

Figure 12. Plan of Excavation and Shovel Test Units in relation to GPR anomalies.

- 1 10YR 4/2 dark grayish brown fine sandy silt
- 2/3 10YR 3/2 very dark grayish brown fine sandy silt
- 4 2.5Y 4/2 dark grayish brown fine sandy silt
- 5/6 10YR 5/4 yellowish brown mottled with 5Y 6/2 light olive gray and 2.5Y 3/2 very dark grayish brown fine sandy silt
- 7 2.5Y 4/2 dark grayish brown sandy silt
- 8 2.5Y 5/3 light olive brown fine sandy silt
- 9 10YR 5/6 yellowish brown mottled with 10YR 4/6 dark yellowish brown sandy silt

EU 1 North Profile

Figure 13. Drawing and photograph of the north profile of EU 1.

Photograph 1. Plan view of Feature 6 and Feature 7, both first exposed in EU 8.

Photograph 2. East profile of Feature 6.

consistent with the construction and demolition of structures shown at this location on the early twentieth century Sanborn maps.

Feature 6, a trash pit, and Feature 7, a post hole, first appeared in EU 8 (Plate 3). Both features consisted of an olive brown (2.5Y4/4) sandy silt. The unit was expanded to further expose Feature 6 by adding EU 11, EU 12, and EU 13. A 4-foot by 3-foot portion of Feature 6 was exposed in these units, but the eastern and northern edges of the feature could not be determined. Feature 6 was bisected along a north/south line, and the western part was excavated (Plate 4). The sides of Feature 6 sloped to a depth of 0.8 feet below its upper surface at its greatest extent. Datable artifacts recovered from the feature produced a mean date of 1894 and a TPQ of 1903. Initial and final mean dates were 1842 and 1935, respectively.

Two additional features, labeled 6A and 6B, were uncovered at the base of the Feature 6. Feature 6A had the appearance in shape and size of a post hole, while Feature 6B was small and irregular. Both proved to be shallow (0.5 feet), suggesting they were slight variations in the base of Feature 6. However, the shape and size of Feature 6A, 0.75 feet by 0.8 feet, was identical to Feature 7, suggesting that the two could represent related post holes. They were spaced 2.5 feet apart which is consent with post holes since they are generally placed at standard intervals rather than irregular (e.g. 2, 2.5, or 3 feet) ones.

The last feature that cut into the third soil layer was located in EU 5. During excavations it was defined as a remnant of the previous level. Its full character only became apparent in profile (Plate 5). The profile of the remnant in the east corner is bowl-shaped, and cut into both the third and fourth soil layers.

The fourth soil layer consisted of a yellowish brown (10YR5/4 or 10YR5/6) clay silt fill. However there was some variation in the layer; in EU 1 it was mottled with a light olive gray (5Y6/2) silty clay and in EU 3 it included a lens of sand and gravel of the same color. The layer was at its thickest near 4th Street measuring about 1.5 feet and became thinner moving toward the house until it was completely absent near the dividing fence. The layer resembled the subsoil within much of New Castle, but in this instance it contained artifacts. Datable artifacts recovered consisted primarily of creamware and pearlware, resulting in a mean date of 1801, with initial and final mean dates three decades to either side. Two of the datable artifacts, a sherd of yellowware (1830-1930) and a plastic button (post 1915), were excluded from the calculation because their dates differed so greatly from the majority. It was assumed they were intrusive.

The fifth soil layer was a light olive brown (2.5Y5/3) fine sandy silt with charcoal flecking. The layer was only fully excavated in EU 1. A small portion of the layer was excavated in EU 3, and samples for floatation were taken from EU 4 and EU 9. Portions of this layer were also recovered in STUs 1, 2, 6, and 7. Datable artifacts recovered from the layer resulted in a mean date of 1783, and a TPQ of 1784. The initial and final mean dates were 1739 and 1827. The layer was not apparent in EU 10, nor in STUs 5, 6, and 7; however, artifacts from these excavations suggest the layer was present, but was a redder color. Nonetheless, those artifacts were not considered in the analysis because of the lack of clarity. Four features, 8 through 11, cut into the fifth layer.

As with the third soil layer, architectural and kitchen/food-related artifacts were dominant. Brick fragments (n=151) were the most common architectural artifacts. Yellow brick fragments were recovered from EU 1 (n=31) and a single piece of yellow brick was recovered from the deepest level excavated in EU 7. Counts of window glass sherds (n=2) and nails (n=15) were small. One unidentifiable piece of hardware was recovered. Of the kitchen/food-related artifacts, ceramics (n=57) and bone fragments (n=43) were the most common. The ceramic sherds were again common types found on archeological sites: redware (n=32), pearlware (n=6), and creamware (n=9). Three bottle glass fragments were

Plate 3. Plan view of Feature 6 and Feature 7, both first exposed in EU 8.

Plate 4. East profile of Feature 6.

Plate 5. North profile EU 5 showing a bowl-shaped cut into the third soil layer.

Plate 6. Plan view of Feature 8.

recovered, one being free-blown, the others not identifiable. Three oyster shell fragments and a pig's tooth were also recovered. The only other artifact recovered was an iron, loop-shanked button.

All of the features that cut into the fifth level were post holes. Feature 8 and Feature 9, neither of which was fully exposed, were square or rectangular (Plate 6 and Plate 7). Each had one side measuring 1.0-foot wide. The width of the remaining side of each is not known. The features were located at opposite corners of the yard, Feature 8 being in EU 2, Feature 9 being in EU 7. Given the distance between the features, no relationship between the two is apparent. Feature 10 and Feature 11 (Plate 7 and Plate 8), located respectively in EU 7 and EU 9, were 0.5-foot square. It is possible that they were part of the same fenceline.

Plate 8. Plan view of Feature 11.

5.0 INTERPRETATIONS AND RECOMMENDATIONS

5.1 INTERPRETATIONS

The archeological information recovered during the excavation, in combination with the available historical information, are used here to present a general characterization of the landscape in the rear yard of the Dutch House and how it changed over time. The artifacts contained within the soil layers provide a basis for establishing periods during which those landscape changes occurred. Elevation data collected during the excavations were used to create a topographic map of each occupational ground surface at the end of its period of use (Figure 14). In combination, the maps and observed features make it possible to describe the general character of the rear yard for each period.

The excavations resulted in the delineation of three occupational (yard) surfaces and two fill layers. In addition, eight features were observed and recorded. The first occupational ground surface (layer 1) and fill layer (layer 2) represent the period since the property was purchased by the DSPA. Layer 3 was occupied during the nineteenth century through the early decades of the twentieth century. It is hereafter referred to as the “nineteenth century layer.” During the early part of the nineteenth century, fill, layer 4, was placed over a large part of the rear yard. Underlying the fill a fifth layer was identified. This layer represents the earliest occupation of the rear portion of the property. Early ceramics such as tin-glazed earthenware, Staffordshire, redware with a trailed slip, and one example of either Borderware or a Dutch ware, were recovered. However, there was no clear artifactual evidence of use of the space before the middle part of the eighteenth century. Layer 5 is hereafter referred to as the “eighteenth century layer.”

Since the eighteenth century the slope of the ground surface in the rear yard has trended downward from the southern corner to the northern corner. However, over time the steepness of the slope and topographical variability were lessened. As illustrated by the topographic map of the eighteenth century surface, the greatest slopes and topographical variation existed into the early decades of the nineteenth century. The highest elevations were along the southwest and southeast edges of the yard, from which the ground dropped from a foot to 1.5 feet to the northern corner. In addition, the surface had a slight undulation, being a mix of slight and moderate slopes. Four posts were in place before the creation of the nineteenth century surface, each being within the higher ground at either the eastern or the western corner. The two at the eastern corner might represent the remnant of a fenceline.

The majority of the eighteenth century occupation layer was capped in the early decades of the nineteenth century with fill consisting of re-deposited subsoil. The variation in the thickness of the fill suggests that the intent was to raise the northern part of the yard to an elevation closer to the elevations elsewhere in the yard. Neither documentary information nor the artifacts included in the fill point to its source, but evidence suggests it did not come from excavation of a basement for the Dutch House. The artifacts in the fill dated to at least one hundred years after the basement was added to the house. The fill, however, may be related in some way to attempts to grade the streets of the town, as represented by the 1805 Latrobe plan.

By the early decades of the twentieth century the slope of the yard was more gradual. Elevation change across the yard had been reduced to one foot. Problematic for use of the yard was a slight depression toward the eastern corner, where ponding of water appears to have occurred. The artifacts within the layer indicate intensive use of the space. However, there was a mix of artifacts associated with occupation (e.g. ceramics) and those associated with demolition of structures making it impossible to associate the overall scatter with a particular household. The occupation-related artifacts might have derived from people living in the “shanty” shown on the 1891 map, but it is also possible that the features located within the

Figure 14. Elevation above sea level of the current and historic ground surfaces.

nineteenth century layer were associated with the occupants of the house that once stood adjacent to the Dutch House at the current location of the garden along 3rd Street.

Feature 1 and Feature 8, located in EU 2 at the northwest corner of the yard are related to one or both structures depicted on the early twentieth century Sanborn maps, while Feature 6 is a trash deposit and Feature 7 is a posthole associated with a household. Features 1 and 8 contained information on the nature of construction and demolition of at least one of the structures, but did not contribute to an understanding of the use of either. Like Features 1 and 8, the interpretive potential of Feature 7 is limited to its basic function as a post hole. For the same period, Feature 6 has provided information on consumer choice, foodways, and trash disposal practices. All of these features point to the persistence of below ground evidence related to late-nineteenth century to early twentieth century use of the rear yard before ownership by the DSPA

After purchase of the two parcels that were to make up the current Dutch House rear yard, the DSPA had fill material brought in to eliminate topographic variation. A slope remained from the south to the north; however, the drop was made gradual and even. In addition, the fill, containing coal and coal ash slag, should have improved surface drainage. The origin of the artifacts within the fill material is not known, so they have no interpretive potential other than characterizing a common early twentieth century fill. The bowl-shaped feature located in EU 5 was the only one uncovered that illustrates activities of the DSPA in the rear yard that are not apparent today. While not unambiguous, it appeared to represent the remains of a small planting such as an immature tree or bush. When related to landscape plans prepared for the rear yard, it is likely evidence of planting of one of the dwarf apple trees. A lack of root staining in the surrounding soils suggests that the tree did not reach a substantial size before being removed, or that the specimen itself had shallow roots. The feature also illustrated the effect of establishing such a planting, as the size of the hole required, in this instance roughly 1.5 feet deep by 2.0 feet wide, resulted in the removal of the nineteenth century layer and part of the re-deposited subsoil at this location.

5.2 RECOMMENDATIONS

Recommendations derive from two factors: the archeological findings, and the nature of root growth for trees and bushes. Significant archeological resources noted from investigations are Feature 6, the trash pit located in the southern corner of the rear yard, and the eighteenth century soil layer. Feature 6 contains information relating to the last occupants of the parcel in the late nineteenth/early twentieth century. More extensive excavation of the eighteenth century soil layer has the potential to reveal information relating to the lives of early residents of the property including tradesmen and their families, and possibly servants and slaves. It would also contribute to the growing body of comparative data on life in eighteenth-century New Castle.

As planned, the native garden has the potential to disturb both Feature 6 and the eighteenth century soil layer. Since Feature 6 is close to the surface, JMA recommends that plantings in the vicinity be limited to shallow rooted species. Disturbance of the eighteenth century layer is dependant on root-growing characteristics of plantings, especially in relation to depth. Root growth varies by species and is influenced by soils chemistry and physical characteristics (e.g. composition and density), as well as access to water (see for example Crow 2005 and Day et al. 2010). However, as a generality, the most robust root growth occurs within the first three feet of the ground surface and proceeds outward more so than downward.

Figure 15 depicts the depth below the ground surface of the eighteenth century layer. The depth varies from around 2.0 feet in the southern part of the yard to nearly 3.0 feet in the northern corner. JMA

**Thickness of Soil Between the
Top of the Modern Surface and
Top of the Eighteenth Century Surface**

recommends that the NCHS consult an arborist to determine the root growing characteristics of the species planned for the garden. To minimize disturbance to the eighteenth century layer, it is recommended that tree planting be limited to the northern corner, where the depth of the layer is greatest.

124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		1 Faunal: Oyster Shell Fragments			
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		1 Blown-In-Mold Bottle Fragment: Dark Aqua			
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		4 Nail: Unidentified			
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		2 Coal: Coal Ash (Slag)			
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		8 Unidentified Bottle Fragment: Clear			
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		1 Faunal: Bone			
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		2 Blown-In-Mold Bottle Fragment: Olive Green			
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		1 Whiteware: Flow Colors			1842-1910
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		1 Redware: Brown Glaze			
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		2 Yellowware: Plain			1830-1930
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		1 Whiteware: Black Transfer Print		Incomplete Maker's Mark, "...N...ED..."	1820-1915
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		5 White Granite Ware: Plain			1842-1930
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		2 Miscellaneous, Metal: Unidentified			
124 SW Quad		6	EÜ 0, 11, 12,	1.2	1.40-1.65		1 Gardening, Ceramic: Flower Pot			
125 SW Quad		6	EÜ 0, 11, 12,	1.3	1.65-1.75		1 Pearlware: Plain		Burnt	1779-1830
125 SW Quad		6	EÜ 0, 11, 12,	1.3	1.65-1.75		1 Unidentified Bottle Fragment: Clear			
126 NW Quad		6	EÜ 11, 12 &	1.1	1.15-1.40		1 Pearlware: Blue Transfer Print			1784-1840
126 NW Quad		6	EÜ 11, 12 &	1.1	1.15-1.40		11 Window Glass: All Thicknesses			
126 NW Quad		6	EÜ 11, 12 &	1.1	1.15-1.40		1 Pipe Stem: 5/64th-Inch Ball Clay			1710-1750
126 NW Quad		6	EÜ 11, 12 &	1.1	1.15-1.40		1 Creamware: Light-Colored Yellow			1775-1820
